

City of Martinsville Annual Water Quality Report for 2023

We are pleased to report no violations of Primary Maximum Contaminants Levels (PMCL) were exceeded during 2023. The Water Resources Department is providing this report for the calendar year 2023 to inform you about the quality of your drinking water. Our goal is to provide you with a safe and dependable supply of drinking water and we want you to be aware of the efforts we make to protect your water supply. The quality of your drinking water must meet State and Federal requirements administered by the Virginia Department of Health (VDH).

GENERAL INFORMATION

As water travels over the surface of the land or through the ground it dissolves with naturally occurring minerals and can pick up substances (referred to as contaminants) resulting from the presence of animals or from human activity. Contaminants that may be present in source water include:

- * Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations and wildlife.

- * Inorganic contaminants, such as salts and minerals, which can be naturally occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil or gas production, mining or farming.

- * Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.

- * Organic chemical contaminants, including synthetic and volatile organic chemicals, which are byproducts of industrial processes and petroleum production and can also come from gas stations, urban stormwater runoff and septic systems.

- * Radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities.

A source water assessment of our system has been conducted by the Virginia Department of Health. The reservoir and creeks were determined to be of high susceptibility to contamination, as are virtually all other surface water sources in the State using criteria developed by the State in its approved Source Water Assessment Program. The assessment report consists of maps showing the source water assessment area, an inventory of known land use activities of concern, and documentation of any known contamination within the prior 5 years. Additional information is available by contacting the waterworks representative noted elsewhere in this report.

In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. FDA regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

All drinking water, including bottled drinking water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline (800-426-4791). Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons, such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines for appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are available from the Safe Drinking Water Hotline (800-426-4791).

Sources and Treatment

Our main raw water source is the Beaver Creek Reservoir. Supplemental sources, as needed, are provided by a pump station on Leatherwood Creek. Before entering the distribution system, your water is treated at the Martinsville Water Treatment Plant to ensure that potentially harmful or otherwise objectionable substances are

removed. At the plant, raw water is treated with chlorine for disinfection, Delpac for coagulation and flocculation, lime and caustic soda are used to raise the pH and add calcium hardness. Fluoride to help reduce tooth decay is also added. The water flows through the sedimentation basins allowing the floc particles to settle out before being filtered. Before water leaves the plant, we add chlorine to maintain a residual throughout the distribution system, sodium hydroxide for pH adjustment, and sodium hexametaphosphate to reduce pipe corrosion.

About Disinfection Byproducts in Drinking Water

Disinfection is an absolutely essential component in the treatment of drinking water, preventing the occurrence and spread of many serious and potentially deadly water-borne diseases. Chlorination is a time proven method for disinfection, but some minute amounts of disinfection byproducts (DBPs) do result in the form of Trihalomethanes (TTHMs) and Haloacetic acids (HAA5s) as chlorine combines with naturally occurring organic matter (such as leaf debris) in the raw water. Some people who drink water containing TTHMs or HAA5s in excess of the MCLs over many years may have an increased risk of getting cancer or could experience problems with their liver, kidneys, or central nervous system. The City's water system complied for DBPs throughout 2023.

Water Quality Results

We routinely monitor for various contaminants in the water supply to meet all regulatory requirements. It is required by the state to make the public aware of any treatment or monitoring violations that may occur during the course of the year. There were no PMCL violations of any drinking water standards during 2023 reporting.

Coliforms are bacteria that are naturally present in the environment and are used as an indicator that other, potentially harmful, waterborne pathogens may be present or that a potential pathway exists through which contamination may enter the drinking water distribution system. We found coliforms indicating the need to look for potential problems in water treatment or distribution. When this occurs, we are required to conduct assessments to identify problems and to correct any problems that are found.

During the past year, we were required to conduct one Level 1 Assessment. One Level 1 Assessment was completed. In addition, we were required to take no corrective actions. The likely source of contamination was identified during this Level 1 Assessment.

About Lead in Drinking Water

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The City of Martinsville is responsible for providing high quality drinking water but cannot control the variety of materials used in plumbing components. The water is treated by adjusting pH and adding a corrosion inhibitor to minimize leaching of lead and copper from plumbing. When your water has been sitting for several hours you can minimize the potential for lead exposure by flushing your tap for 15 to 30 seconds or until it becomes cold or reaches a steady temperature before using water for drinking or cooking. If you are concerned about lead in your water, you may want to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water hotline or <http://www.epa.gov/safewater/lead>. *If you have questions about this report, want additional information about any aspect of your drinking water or want to know how to participate in decisions that may affect water quality, please write to the address below or call 276-403-5157. Regularly scheduled City Council meetings are held on the 2nd and 4th Tuesday of each month at 7:30 PM in the City of Martinsville administration building located at: 55 W. Church Street.*

WATER QUALITY RESULTS						
Regulated						
Substance/Units	MCLG	MCL	Level Found/Range	Violation	Date of Sample	Typical Source of Substance
Fluoride ppm	4	4	Yearly Daily Avg : 0.72 Range : 0.35 to 0.89	No	Daily	Erosion of natural deposits; water additive which promotes strong teeth; Discharge from fertilizer and aluminum factories.
Total Coliform MPN/100 mL	0	Present < 5% of monthly samples	2 (May2023)	Level 1	Weekly	Naturally present in the environment
Turbidity NTU	NA	TT = 1.0 NTU Max TT = 95% of monthly samples must be < 0.3 NTU	Max : 0.51 Lowest monthly percentage of samples < 0.3 = 99%	No	Continuous / Every 2 hrs.	Soil runoff (Turbidity itself is not harmful, but high levels may indicate other treatment problems).
Total Trihalomethanes ppb	NA	80	Max Rolling Avg: 47 Range 28-56	No	Every 90 days	By-product of drinking water chlorination (See "Disinfection Byproducts" on other side)
Haloacetic Acids ppb	NA	60	Max Rolling Avg: 44 Range: 26-52	No	Every 90 days	By-product of drinking water chlorination (See "Disinfection Byproducts" on other side)
Total Organic Carbon ppm	NA	TT - TOC removal ratio greater than or equal to 1.0	Yearly Rolling Avg Removal Ratio: 1.36 Range: 1.19 to 1.50	No	Monthly	Naturally present in the environment.
Chlorine ppm	MRDLG = 4	MRDL = 4.0	Yearly Daily Avg: 1.54 Range 1.00 to 2.30	No	Every 2 hrs.	Water additive used to control microbes.
Copper ppm	1.3	AL = 1.3 mg/L	90th Percentile-passed .105 Range: ND-0.211 0 of the 32 samples above AL	No	August 2022	Corrosion of household plumbing systems; erosion of natural deposits.
Lead ppb	0	AL = 0.015 mg/L	90th Percentile-passed 11.1 Range ND-40.7 Two of the 32 Samples Above AL	No	August 2022	Corrosion of household plumbing systems; erosion of natural deposits.
Gross Alpha pCi/L	0	15	0.4	No	May 2022	Erosion of natural deposits
Combined radium pCi/L	0	5	0.4	No	May 2022	Erosion of natural deposits
Barium ppm	2	2mg/L MCL	.017	No	August 2023	Discharge of drilling wastes; discharge from metal refineries; erosion of natural deposits".
Unregulated						
Sodium ppm	NA	NA	11.3	No	August 2023	Naturally occurring in environment; added by some of the chemical addition at the treatment plant
Hardness ppm	NA	NA	20	No	August 2023	Measure of naturally occurring hardness metals
Aluminum ppm	NA	0.05-0.2 ppm SMCL	ND	No	August 2023	Naturally occurring and from water additives used to treat water; when above the SMCL, can lead to aesthetic problems (color)

Cryptosporidium-In 2018 The City of Martinsville analyzed 24 samples of source water for cryptosporidium. These samples were collected before any treatment had been applied at the water treatment plant. Cryptosporidium is a microbial pathogen found in surface water throughout the U. S. Ingestion of cryptosporidium may cause cryptosporidiosis, an adominal infection. Symptoms of infection include nausea, diarrhea, and adominal cramps. Most healthy individuals can overcome the illness within a week. However, immune-compromised individuals, infants and small children and the elderly are at a higher risk. Cryptosporidium must be ingested to cause illness and may also come from sources other than water. The City of Martinsville Department of Water Resources works diligently to optimize the filtration process in order to ensure cryptosporidium removal.

Definitions

Maximum Contaminant Level (MCL) - the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology. In developing the standards EPA assumes that the average adult drinks 2 liters of water each day throughout a 70-year life span. EPA generally sets MCLs at levels that will result in no adverse health effects for some contaminants or a one-in-ten thousand to one-in-a-million chance of having the described health effect for other contaminants.

Maximum Contaminant Level Goal (MCLG) - the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level (MRDL) – the highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG) – the level of a drinking water disinfectant below which there is no known or expected risk of health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contamination.

Non-detects (ND) - lab analysis indicates that the contaminant is not present

Parts per million (ppm) or Milligrams per liter (mg/l) - one part per million corresponds to one minute in two years.

Parts per billion (ppb) or Micrograms per liter - one part per billion corresponds to one minute in 2,000 years.

Nephelometric Turbidity Unit (NTU) - is a measure of the clarity of water. Turbidity in excess of 5 NTU is just noticeable to the average person.

Action Level (AL) - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Secondary Maximum Contaminant Level (SMCL) - non-enforceable guidelines regarding contaminants that may cause cosmetic effects (such as skin or tooth discoloration) or aesthetic effects (such as taste, odor or color) in drinking water.

Treatment Technique (TT) - a required process intended to reduce the level of a contaminant in drinking water.

Picocuries per liter (pCi/L) - is a measure of the radioactivity in water.

Level 1 Assessment- A study of the waterworks to identify potential problems and determine, if possible, why total coliform bacteria have been found in waterworks

Monitoring Notes

We constantly monitor for various contaminants in the water supply to meet all regulatory requirements. The tables list only those that had some level of detection. Most of the results are from 2023, but state allows for some contaminants to be done less frequently.
